This book analyses how high technology production has shifted from a regional to a global scale. Using the example of semi-conductors it illustrates the interaction of the developed industrial and developing industrialising nations. This book should be of interest to lecturers and students of international economics and international business, professionals dealing with multinationals.

In *Windows into the Soul*, Gary T. Marx sums

up a lifetime of work on issues of surveillance and social control by disentangling and parsing the empirical richness of watching and being watched. Ultimately, Marx argues, recognizing complexity and asking the right questions is essential to bringing light and accountability to the darker, more iniquitous corners of our emerging surveillance society.

Rural America is at a crossroads in its economic development. Like regions of other First World nations, the traditional economic base of rural communities in the United States is rapidly deteriorating. Natural resources, including agriculture, show little prospect for generating future job growth,

and manufacturing has become a new source of instability. Faced with these changes and an increasing vulnerability to international economic events, rural communities have begun to seek high-technology industries and advanced services as candidates for job growth and economic stability. What is the potential for high-tech growth outside the largest cities? What is the role of high-tech industry in the economic development of non-metropolitan America? This book provides a hard-nosed look at the high-tech potential in rural economic development. Some of the questions Glasmeier addresses include: Are

rural areas attractive to high tech? Will high tech follow earlier patterns and filter down the lowest-paid jobs to rural areas? Will rural communities be bypassed completely for even lower-wage Third World locations? Glasmeier answers in a sober analysis that separates fact from myth. Empirical data reveals the kinds of high-tech jobs that locate in rural areas, and the kinds of rural areas that attract high-tech jobs. This analysis leads to a highly critical evaluation of state and local economic development policy and recommendations for its improvement. This book is a must for

Originally published in 1988, this book explores how new technologies, industrial innovation and the growth of high technology industry have affected regional employment and economic change in different European countries. It discusses the factors which make some areas better suited than others to the development of the new industries, emphasising how functional integration and

Attempts to encourage innovation and the development of high technology industry in old industrial areas are discussed, with particular reference to the role of large firms, training programmes and government policies.

modern industrial development. It appraises government policies for assisting the development of this sector and focuses on the fact that high tech industry tends to be concentrated in particular regions of countries which attain the status of 'successful populations'. High technology industry seems to offer little benefit to declining manufacturing areas and the book offers explanations for these regional concentrations and assesses the likely consequences.
